

Applications

PACKAGING APPL CAT ON NYLON BAG OPENING STATIC APPLICATION

In bag production for forming handle part of bags, handle part is generated with a cutting knife system before cutting process. During this process air can enter in plastic which will cause incorrect cutting. This will lead to lossy and incorrect production.

For preventing this production problem, charging bar should be placed before cutting knife which has opposite charges. Thus, entrance of air and sticking of plastic that will be cut is avoided and a reliable production is provided.
