

Applications

PACKAGING APPL CAT ON BUFFER MACHINE STATIC APPLICATION

In buffer machines, buffer which is a silicon based material and touches to surface to be printed, is charged with static electric because of friction. So, it will cause paint to splash. This is an undesired condition that will affect production quality and speed negatively. Filth and dust that stick to buffer will lead to printing faults and losses.

Nozzle will neutralize static charge on buffer surface and prevent paint splashing. Dust and filth will be prevented by an anti static bar placed on conveyor. So, a reliable production is obtained.
