## PACKAGING APPL CAT ON TAMPON PRINTING APPLICATION SHEET

Due to polymer make up of the print head and the very nature of Tampon printing, you are continually creating static on the head of the printer. This is due to friction and separation of materials and surfaces.

For the solution of this problem, By positioning either a PULSElectronic bar or nozzle in a position the will bathe the head in an ion field after each print stage, you will eliminate the charge, prevent spidering and fogging of print, increase productivity, reduce waste and improve profits.
